

WHAT IS CLAIMED IS:

Sub A16 1. A group III nitride compound semiconductor device

comprising:

a substrate;

5 an undercoat layer formed on said substrate and having a surface with convex portions each shaped like a truncated hexagonal pyramid; and

a group III nitride compound semiconductor layers formed on said undercoat layer and having a device function.

Sub B17 2. A group III nitride compound semiconductor device

according to claim 1, wherein said undercoat layer is made of GaN doped with magnesium.

Sub C18 3. A group III nitride compound semiconductor device

according to claim 2, wherein a magnesium concentration of said undercoat layer is not lower than $10^{20} / \text{cm}^3$.

Sub A17 4. A group III nitride compound semiconductor device

20 according to claim 2, wherein said undercoat layer is doped with an n-type dopant and is of an n type as a whole.

Sub B17 5. A group III nitride compound semiconductor device

according to claim 1, wherein said substrate is made of one of sapphire, SiC and silicon single crystal.

DESENCOLE - DRAFT

Sub A18
6. A group III nitride compound semiconductor device according to claim 1, further comprising a sedimentary layer interposed between said undercoat layer and said substrate.

Sub A18
7. A group III nitride compound semiconductor device according to claim 1, wherein said group III nitride compound semiconductor layers have a function one of a light-emitting device, a photodetector and an electronic device as a whole.

10 8. A method for producing a group III nitride compound semiconductor device, comprising steps of:

forming an undercoat layer on a substrate so that said undercoat layer has a surface of a texture structure;

15 forming a growth suppressing material layer on said undercoat layer so that said undercoat layer is partially exposed; and

growing a group III nitride compound semiconductor layer on said undercoat layer and on said growth suppressing material layer by performing an epitaxial lateral overgrowth method.

20

9. A method for producing a group III nitride compound semiconductor device according to claim 8, wherein the step of forming said undercoat layer is performed under a condition of a temperature in a range of from 1000°C to 1200°C.

25

10 10

10. A method for producing a group III nitride compound semiconductor device according to claim 8, wherein said growth suppressing material layer is made of at least one member selected from the group consisting of Fe, Co, Ni, Cr, Mo, W, Ag, Rh, oxides of those members, SiO_x and SiN_x .

11. A method for producing a group III nitride compound semiconductor device according to claim 8, wherein said undercoat layer is made of a group III nitride compound 10 semiconductor.

12. A method for producing a group III nitride compound semiconductor device according to claim 11, wherein said substrate is made of sapphire and said undercoat layer is made 15 of AlN.

13. A method for producing a group III nitride compound semiconductor device according to claim 12, wherein a thickness of the AlN layer is in a range of from 0.2 to 3.0 μm .

20 20

14. A method for producing a group III nitride compound semiconductor device according to claim 12, wherein a thickness of the AlN layer is in a range of from 0.5 to 1.5 μm .

25 25

15. A method for producing a group III nitride compound

semiconductor device according to claim 8, further comprising a step of forming a sedimentary layer before the step of forming the undercoat layer.

5 16. A method for producing a group III nitride compound semiconductor device, comprising steps of:

 forming an undercoat layer on a substrate so that a surface of said undercoat layer is formed as a sectionally trapezoid shape;

10 forming a growth suppressing material layer on said undercoat layer so that said undercoat layer is partially exposed; and

15 growing a group III nitride compound semiconductor layer on said undercoat layer and on said growth suppressing material layer by performing an epitaxial lateral overgrowth method.

17. A method for producing a group III nitride compound semiconductor device according to claim 16, wherein the step of forming said undercoat layer is performed under a condition 20 of a temperature in a range of from 1000°C to 1200°C.

18. A method for producing a group III nitride compound semiconductor device according to claim 16, wherein said growth suppressing material layer is made of at least one member 25 selected from the group consisting of Fe, Co, Ni, Cr, Mo, W,

DRAFTSHEET-DRAFT

Ag, Rh, oxides of those members, SiO_x and SiN_x .

19. A method for producing a group III nitride compound semiconductor device according to claim 16, wherein said 5 undercoat layer is made of a group III nitride compound semiconductor.

20. A method for producing a group III nitride compound semiconductor device according to claim 19, wherein said 10 substrate is made of sapphire and said undercoat layer is made of AlN.

21. A method for producing a group III nitride compound semiconductor device according to claim 20, wherein a thickness 15 of the AlN layer is in a range of from 0.2 to 3.0 μm .

22. A method for producing a group III nitride compound semiconductor device according to claim 20, wherein a thickness of the AlN layer is in a range of from 0.5 to 1.5 μm .
20

23. A method for producing a group III nitride compound semiconductor device according to claim 16, further comprising a step of forming a sedimentary layer before the step of forming the undercoat layer.
25

24. A method for producing a group III nitride compound semiconductor device, comprising steps of:

forming an undercoat layer on a substrate so that a surface of said undercoat layer is formed as a pit shape;

5 forming a growth suppressing material layer on said undercoat layer so that said undercoat layer is partially exposed; and

growing group III nitride compound semiconductor layers on said undercoat layer and on said growth suppressing material 10 layer by performing an epitaxial lateral overgrowth method.

25. A method for producing a group III nitride compound semiconductor device according to claim 24, wherein the step of forming said undercoat layer is performed under a condition 15 of a temperature in a range of from 1000°C to 1200°C.

26. A method for producing a group III nitride compound semiconductor device according to claim 24, wherein said growth suppressing material layer is made of at least one member 20 selected from the group consisting of Fe, Co, Ni, Cr, Mo, W, Ag, Rh, oxides of those members, SiO_x and SiN_x .

27. A method for producing a group III nitride compound semiconductor device according to claim 24, wherein said 25 undercoat layer is made of a group III nitride compound

semiconductor

28. A method for producing a group III nitride compound semiconductor device according to claim 27, wherein said 5 substrate is made of sapphire and said undercoat layer is made of AlN.

29. A method for producing a group III nitride compound semiconductor device according to claim 28, wherein a thickness 10 of the AlN layer is in a range of from 0.2 to 3.0 μm .

30. A method for producing a group III nitride compound semiconductor device according to claim 28, wherein a thickness 15 of the AlN layer is in a range of from 0.5 to 1.5 μm .

31. A method for producing a group III nitride compound semiconductor device according to claim 24, further comprising 20 a step of forming a sedimentary layer before the step of forming the undercoat layer.
